Ans: to the ques. no-4

Increasing the cost of fuel is the best way to solve global environment problem

Outline

for	against
1.Individual will use cars less often.	1.Todays cars are more efficient
2.Industry will release less carbon.	2.World economy will fall.
3.More people will use public transport	3.Lower class people will strive.

Introduction:

Thesis statement: The increasing of the cost of fuel would hurt the lower class people, place higher costs on current and prospective car owners, and be detrimental to the economy of a nation.

Logical reason 1:Hurt the lower class people

Topic sentence:firstly rise of oil price will rise the price of meals,vehicle fare,jobless people.

*supporting details 1:*Rise of food price.

*Supporting details 2:*vehicle fare will rise

*supporting details 3:*more people will jobless

Logical reason 2:detrimental to the economy

Topic sentence :Furthermore, rise of oil price will reduce the productivity of electricity,manufacturing industries and agricultural purposes.

*Supporting details 1:*Electricity production hampered.

*Supporting details 2:*Car manufacture will face difficulties

*supporting details 3:*Agriculture will let up.

Refutation:

*Topic sentence:*However ,many people think that increasing the price of oil will reduce the use of vehicle, factories will release less carbon;I think we can overcome this by using fuel efficient cars and modern machine.

*Opponents idea:*Reduce vehicle and incresing carbon.

My refutation:

- Using efficient cars.
- Using modern machine
- Raising awareness

conclusion:

- Fall of economy and food production
- Being aware
- Using green energy

Increasing the cost of fuel is the best way to solve global environment problem

Fuel is any substance used to produce heat and energy through a chemical or nuclear reaction. The energy is used by the conversion of a portion of the fuels mass. Fuel serves as a major part of our energy requirement. Petroleum, a major fuel is widely used in our everyday lives and also used to power automobiles, produce containers and to keep us warm. All plastic is made from it and used in cars, houses, computers, paraffin wax, paints and pharmaceuticals, at times it is also used as a solvent found in large quantities below the surface of the Earth and is used as fuel and raw material in the chemical industry.

Firstly , increase the cost of fuel will reduce the prodductivity of a country. Every country on the planet is dependent of fuel. Fuel used in many thing like factories , vehicle etc. If the price of fuel increases the price of daily comodities will be increase and as a result the lower and poor people will strive to fulfill daily needs. Also as factories runs out of fuel for high price, their production will decline and as a result many people will lose their jobs . Also public transport will increase their fare.

Secondly, the world is imensely dependent on electricity, agriculture etc. For many years we use modern machine on our agriculture and those machine use fuel as their main impetus. Increasing the price of fuel will obstacle for proction of crops and vegetables. And that cause the hike of prices of these comodities. We produce our electricity from mainly gas , and increasing of fuel price will increase the price of gas. Country GDP will fall in short of electricity. we can't spend a day without electric power.

However many people think that Increasing the cost of fuel is the best way to solve global environment problem. I think increasing the price of fuel can help reduce the environmental pollution to some degree. In other words, excessive use of cars releases carbon dioxide into the atmosphere which is detrimental to the environment. If the price of fuel is increased / hiked), individuals will start to use their cars less often and this in

turn can decelerate the rate of air pollution. However, the increase in the cost of fuel will not stop the environmental pollution. We can use renewable energy like solar energy ,wind energy,electric cars.This may reduce the global environmen problem.

To conclude ,among many negetive side effect of fuel oil ,we can't hike the price of fuel oil .We are mostly dependent on it and we can't replace it overnight.But we can reduce the use of it by increasing awareness.People should use more public transport rather than private.We can change our focus from fuel energy to renewable energy.We individuals can't change the environment only by increasing fuel price,also this may bring destruction ,but we can change our habit and priority of chosing things and make this world a better place for living .
